Chapter 6: Normal Distribution

Dr. Siddiqua Mazhar

Mid Michigan College

Oct 14, 2021

Normal Distribution

If the continous random variable has a symmetric, bell shape curve, it is considered to have a Normal Distribution.

Properties of the Normal Distribution

- Bell shaped
- Mean - Median - Mode in Center (all the same)
- Symmetric
- No gaps in data (continuous curve)
- Never crosses x-axis
- Area under the curve is equal to 1.
- Satisfies Empirical rule.

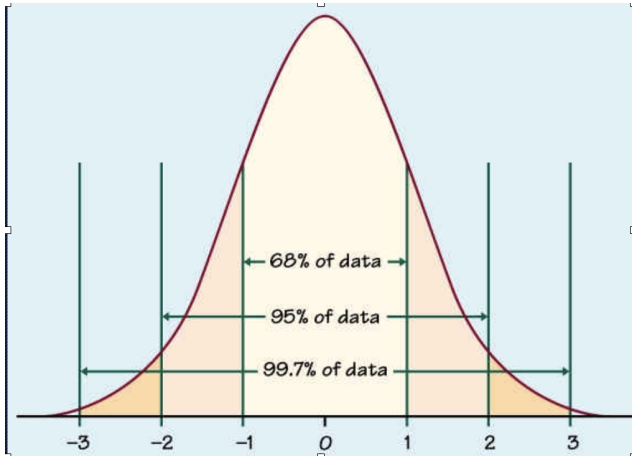
Uniform Distribution

All values have the same probability of occuring.

- Area must be equal to 1.
- Height for each value is greater or equal to 0 and less than or equal to 1.

Normal Distribution (Concept)

Empirical Rule



Normal Distrubution Questions

- Find area under the curve (Find Probabilities)
- Find the z-score
- Find the X-values on X-axis or Data points.

Standard Normal Distribution

Normal curve with

- $\mu = 0$
- $\sigma = 1$

Note: Transform any normal distribution to a standard normal distrubution. by mapping mean to 0 and Standard deviation to 1.

Example: Testing Thermometers

Mean: $\mu = 0$
S.D.: $\sigma = 1$
Readings were normally distrubuted. Find the probability that a thermometer will have a reading of less than 1.58 degree.

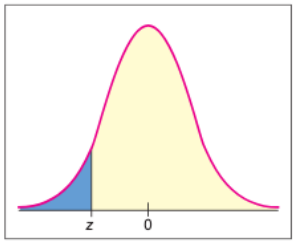
Step 1: Find Z-score.

Step 2: Draw a picture.

Step 3: Find the area

- Using a Table
- Using a Calclulator

Empirical Rule



The table entry for z is the area to the left of z.

TABLE 5 **Areas of a Standard Normal Distribution**

(a) Table of Areas to the Left of z

z	.00	.01	.02	.03	.04	.05	.06	.07	.08	.09
−3.4	.0003	.0003	.0003	.0003	.0003	.0003	.0003	.0003	.0003	.0002

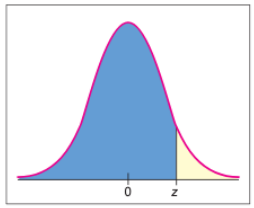
−0.4	.3446	.3409	.3372	.3336	.3300	.3264	.3228	.3192	.3156	.3121
−0.3	.3821	.3783	.3745	.3707	.3669	.3632	.3594	.3557	.3520	.3483
−0.2	.4207	.4168	.4129	.4090	.4052	.4013	.3974	.3936	.3897	.3859
−0.1	.4602	.4562	.4522	.4483	.4443	.4404	.4364	.4325	.4286	.4247
−0.0	.5000	.4960	.4920	.4880	.4840	.4801	.4761	.4721	.4681	.4641

For values of z less than −3.49, use 0.000 to approximate the area.

Empirical Rule



The table entry for z is the area to the left of z.

For z values greater than 3.49, use 1.000 to approximate the area.

TABLE 5 *continued*

(b) Confidence Interval Critical Values z_c	
Level of Confidence c	Critical Value z_c
0.70, or 70%	1.04
0.75, or 75%	1.15
0.80, or 80%	1.28
0.85, or 85%	1.44
0.90, or 90%	1.645
0.95, or 95%	1.96
0.98, or 98%	2.33
0.99, or 99%	2.58

TABLE 5 *continued*

(c) Hypothesis Testing, Critical Values z_0		
Level of Significance	$\alpha = 0.05$	$\alpha = 0.01$
Critical value z_0 for a left-tailed test	-1.645	-2.33
Critical value z_0 for a right-tailed test	1.645	2.33
Critical values $\pm z_0$ for a two-tailed test	± 1.96	± 2.58

Using Calculator

Normalcdf(left value, right value, μ, σ)

Example: Testing Thermometers

Mean: $\mu = 0$

S.D.: $\sigma = 1$

Readings were normally distrubuted. Find the probability that a thermometer will have a reading greater than 1.23 degree.

Example: Testing Thermometers

Mean: $\mu = 0$

S.D.: $\sigma = 1$

Readings were normally distrubuted. Find the probability that a thermometer will have a reading between -2 and 1.5 degrees

Questions: Find the area under the curve

For Standard Normal Distrubution, find the following:

- $P(-1 \leq z \leq 1)$
- $P(-1.5 \leq z < 1.5)$
- $P(-3.2 < z \leq 3.2)$
- $P(z < 1)$
- $P(z \leq 0.65)$
- $P(z > -3.4)$
- $P(0 < z \leq 0.65)$

Finding Z scores From Areas

Work backward by using an area (probability) to find the distance from the mean (Z-score).

Step 1: Draw a picture.

Step 2: Use Table (In reveres) OR Calculate (INVNORM)

Using $invNorm(Area, \mu, \sigma)$

Example: Finding Z scores From Areas

For thermometer, find the z-score that presents the bottom 95% of the data.

Example: Finding Z scores From Areas

For thermometer, find the z-score that presents the top 30% of the data.

Example: Finding Z scores From Areas

For thermometer, find the z-score that presents the bottom 10% of the data.

Example: Finding Z scores From Areas

For thermometer, find the z-score that presents the top 80% of the data.

Example: Finding Z scores From Areas

Find the z-score that give the area between the top 2.5% and the bottom 2.5%.

Example:

A population of man has a mean weight of 172lbs and a standard deviation of 29 lbs. Find probability that a randomly selected man will have a weight of less than 174 lbs.

Example:

IQ is normally distrubuted with a mean of 100 and standard deviation of 15. What percentage of people have an IQ between 85 and 125?

Key points

- Z- score is a distance
- Area is a Probability
- Z- score can be negative
- Area can not be negavtive

Finding a value from the z-score

$$z = \frac{X - \mu}{\sigma}$$

$$\sigma.z = X - \mu$$

$$X = \sigma z + \mu$$

Example: Finding a value from the z-score

A population of man has a mean weight of 172lbs and a standard deviation of 29 lbs. What weight seperates the lightest 99.5% from the heaviest 0.5%

Example: Finding a value from the z-score

Grip-Reach for women is normally distrubuted. The mean is 27.0 inch with a standard deviation of 1.3 inch. Find the Grip-Reach that represents the longest 95% of women.

Exercise

According to an article in cnbc.com, the average student debt for new college graduates was $\$37,172$ in 2016. Assume the debt is normally distributed with a standard deviation of $\$14,600$. Find the probability that a new college graduate owes between $\$20,000$ and $\$60,000$.
